Test

Below is a **simple, step-by-step testing guide** for your pediatric patient-education system. It's organized as **User side**, **Admin side**, and a **Testing team checklist**. Keep it open while you click through the app.

---

1) User Side Testing (Doctors/Clinic Staff & Patients)

A. Doctor/Staff Login & Portal Branding

Goal: The clinic portal is whitelabeled and accessible only to clinic members.

- Go to `/portal/<clinic_slug>/login/`
  - Enter username & password → **Expected:** Redirect to `/portal/<clinic_slug>/` (portal home).
  - Wrong password → **Expected:** Friendly "Invalid username or password."
- On portal home:
  - **Logo, clinic name, address** show correctly.
  - If you sign out → **Expected:** Redirect to login for that clinic.
- Try opening another clinic's portal URL that you're **not** a member of → **Expected:** "You do not have access" / forbidden.

B. Search & Discovery (Doctor/Staff)

Goal: Doctors can find videos/subtopics quickly; banners show for active campaigns.

- On `/portal/<clinic_slug>/`:
  - Type a word in **Search**; pick a **Language**; press **Search**.
    - **Expected:** "Matches in selected language," then "English matches (fallback)" if needed.
    - Try different languages to see localized titles.
  - **Banners** at the bottom:

- If this clinic's doctors are in **active campaigns**, multiple banners show ("supported by ").
- Change a campaign end date to yesterday → **Expected:** Banner disappears on refresh.

C. Sharing Flows (Doctor/Staff)

Goal: Share a single video, a subtopic, or the entire portal via WhatsApp with pre-filled text.

1. Go to `/portal/<clinic_slug>/share/`.
2. **Single video:**
   - Select **"Single video"**, pick a **Subtopic** → **Video** dropdown fills with videos in that subtopic.
   - Pick **Language** (list auto-filters to languages available for that video).
   - Enter **Patient WhatsApp (10 digits)**.
   - Click **Share** → **Expected:** Redirect to confirmation page showing the message text and an **"Open WhatsApp"** button.
   - Click **Open WhatsApp** → **Expected:** WhatsApp opens with the message pre-filled (on desktop, it opens web.whatsapp.com).
3. **Subtopic:**
   - Select **"Subtopic"**, pick a subtopic, choose **Language**, enter **WhatsApp**, click **Share** → same confirmation behavior.
4. **Share entire portal:**
   - Leave subtopic/video alone, choose **Language**, enter **WhatsApp**, click **"Share entire portal"** → same confirmation behavior.
5. **What should be created (no need to check DB):**
   - A **share link** token is generated.
   - A **share event** is recorded.
   - A **message** is queued/sent and shows its status in the messages dashboard.

Feature checks:

- **Typeahead chips**: Start typing in the “Type to search” field → suggestions appear → clicking a chip fills the box.
- **Language availability**: For single video, the language dropdown disables languages **not** available for that video.
- **Validation**: Missing number or wrong format → clear field error.

Edge cases (user-visible):

- Wrong phone format / empty required fields → friendly error, no send.
- Sharing the **same content twice quickly** → second attempt should be marked as duplicate and not send twice (confirmation still shows).
- WhatsApp not installed (on phone) → browser opens WhatsApp Web; on locked/unsupported devices it may show a prompt to install.

D. Patient Pages (from the Shared Link)

Goal: Patients can watch a linked video, see more related videos, or browse the portal.

1. Open the link received (format `/s/<token>/`):
   - If **video link**:
     - **Expected:** A page with **embedded YouTube** player, localized title, thumbnail fallback.
     - Button **“For more videos click here”** → opens that **subtopic page**.
     - Button **“Back to home”** → opens the **home** page.
   - If **subtopic link**:
     - **Expected:** A grid of **video thumbnails** and titles (localized/fallback).
     - Clicking a **video thumbnail** → opens the **video page**.
     - Button **“Back to home”** → home page.
   - If **portal link**:
     - **Expected:** A grid of **subtopics** (localized names & thumbnails). Clicking a subtopic opens the **subtopic page**.
2. **Language fallback:** If a local language title/thumbnail is missing, English or default thumbnail is shown.

3. **Broken/invalid token:**
    - Use a random token in the URL → **Expected:** “Page not found” or similar error page.

Edge cases (patient-visible):

- YouTube video removed/unavailable → player shows “Video unavailable”.
- Slow networks → player loads slowly, page still shows titles and buttons.
- Using **Back** button from browser → should return to the previous portal page.

E. Doctor & Field-Rep Registration (optional user-visible flows)

Self-registration (doctor):

- Open **self-registration link** (`/r/<token>/`).
- Fill: **Full name, Email, WhatsApp (10 digits), IMC, Address + Postal code, State** (+ optional photo).
- Submit → **Expected:** Success page shows the **portal link** for that clinic.
- Register the **same doctor (same IMC)** again → **Expected:** No duplicate doctor; details update.

Field-rep registration (doctor under a campaign):

- Open **field-rep link** (`/fr/<token>/`).
- Enter **Field Rep Number** (10 digits) + doctor details; submit.
- If campaign is **at capacity** → friendly error.
- If doctor already registered → **Expected:** No duplicate; tagged to campaign if not tagged.

---

2) Admin Side Testing

A. Access & Roles

- Admin URL (as configured) → **Expected:** Admin login page.
- Log in as staff:

- **/ops/messages/** (messages dashboard) and **/ops/analytics/** (analytics) load.
- Non-staff user should **not** access these pages (should see a login prompt or forbidden).

B. Publishing Console (Content)

Goal: Create and localize subtopics and videos.

- **Therapy Area**: Add one.
- **Subtopic**: Add subtopic, upload **default thumbnail** → **Expected:** Preview image shows.
- **Subtopicl18n** inline: Add names and **localized thumbnails** for 1–2 languages.
- **Video**: Add video under the subtopic;
  - **Videol18n** inline: add localized **title/keywords** and a valid **YouTube URL** → invalid URL should be rejected with a clear error.
  - Upload **video thumbnail** → preview shows.

C. Campaigns & Registration Links

Goal: Create campaign, generate a registration link, and try field-rep registration.

- **Create a campaign**: set brand, therapy area, start/end, **max doctors**.
- **Add campaign subtopics** inline.
- Click **"Create doctor registration link"** → open created link, use **"Download link"** or copy the path.
- Try **field-rep registration**:
  - If registering **new doctors** until the **max doctors** limit is reached → the next registration should show a **capacity reached** error.
  - Register the **same doctor** again → allowed, but should be marked as **duplicate**, not counted twice.

D. Doctor/Clinic Management

- **Self-registration** path creates/updates a **Doctor** and a **Clinic**, and links them.
- In admin, create a **User** and a **Clinic Member** linking that user to the clinic → test portal login works only for members of that clinic.
- Toggle a clinic's **primary color** or logo URL → check portal header branding changes.

E. Messaging & Delivery

- In **Outbound Messages** (admin), check that a **WhatsApp** message created by a share shows:
  - A status (e.g., "queued"/"sent"/"delivered") and **provider message id** if sending is enabled.
  - If providers are disabled, status should note **"dry-run"**.
- Go to **/ops/messages/**:
  - **By status** totals show recent activity.
  - **By day** table aggregates counts.
- If you have real provider credentials:
  - Send a WhatsApp message and wait → status should move to **delivered**; otherwise use the webhook test payload to simulate an update.

F. Analytics & CSV Exports

- Open **/ops/analytics/**.
  - Set **From** / **To** dates and **Apply**.
  - Verify **Shares by Doctor/Clinic/Brand** (with CTR) and **Active Campaigns** show.
  - Click **Export CSV** on each card → **Expected:** CSV downloads with proper totals and CTR%.

G. Governance: Retention, Backups, Security (quick checks)

- **Retention (masking):** Run the masking job for old records; confirm old patient numbers display as `xxxxxx1234` in Share Events and Outbound Messages.
- **Backups/Restore:** Run the backup script, then restore into a local DB; the app should start and show your data.
- **Security basics:**
  - Admin URL is **not** the default if you changed it.
  - **/healthz** returns `{ "ok": true }`.
  - Webhook endpoints should not respond to excessive rapid requests (basic rate-limit) and, if signatures are enabled, reject invalid signatures.
  - A clinic member **cannot** access another clinic's portal.

---

3) Testing Team Checklist (quick pass)

A. Basic Functionality

- [ ] Doctor/Staff login → portal home.
- [ ] Search with language filter; localized results & English fallback.
- [ ] Campaign banners appear/disappear by date.
- [ ] Share **single video**, **subtopic**, **entire portal**.
- [ ] Confirmation page shows message + **Open WhatsApp**.
- [ ] Shared link opens correct patient page (video/subtopic/home).
- [ ] "For more videos" & thumbnail clicks go to the right pages.

B. UI/UX

- [ ] Clinic branding (logo, color) present across portal and patient pages.
- [ ] Clear labels and helpful hints on share page.
- [ ] Consistent button styles and spacing; readable on small screens.

C. Error Messages

- [ ] Wrong password → clear error.
- [ ] Invalid phone number → clear error.

- [ ] Invalid YouTube URL → clear error.
- [ ] Campaign capacity reached → clear error.
- [ ] Invalid/expired token → “Page not found” or clear message.

D. Link & Redirection

- [ ] Portal login → portal home.
- [ ] Share submit → share confirmation.
- [ ] Confirmation **Open WhatsApp** opens correct app/web.
- [ ] Video page **For more videos** → correct subtopic page.
- [ ] Subtopic page **Back to home** → home page.
- [ ] CSV export links download files.

E. Input Validations

- [ ] Email must look valid.
- [ ] WhatsApp numbers must be **10 digits** (no country code).
- [ ] IMC number required for doctor registration.
- [ ] Language selection required.
- [ ] YouTube link must be a real YouTube format.

F. Broken Links & Images

- [ ] All menu/navigation links work.
- [ ] Thumbnails load; fallback shows when missing.
- [ ] YouTube player loads (or shows “unavailable” gracefully).

G. Mobile vs Desktop

- **On mobile (phone):**
  - [ ] Pages fit the screen; buttons are tappable.
  - [ ] “Open WhatsApp” opens the app.
  - [ ] Video player plays inline.
- **On desktop:**

- ☐ WhatsApp link opens web.whatsapp.com.
- ☐ Video player embedded and responsive.

H. Access Controls

☐ Non-member cannot access another clinic's portal.

☐ Staff-only dashboards (**/ops/messages**, **/ops/analytics**) prompt for login or show forbidden to non-staff.

☐ Admin area only for admin users.

I. Edge Cases & Resilience

☐ Share the **same content twice quickly** → only one actual send; second marked duplicate.

☐ Old share links still open pages even if the campaign later ends (banners should change accordingly).

☐ Slow network: pages remain usable, text loads first.

☐ Logging out clears access.

> Note on OTP: There is no OTP flow in this release. If you add OTP later, include checks for code delivery, wrong/expired code, and resend limits.

Tip for the team: Keep this guide next to the app. Test **happy paths first**, then run through **edge cases**. If something feels confusing, write down the exact page and wording so it can be improved quickly.
